Description

Our seas are increasingly exposed to a wide range of pollutants, including pharmaceuticals, pesticides, personal care products and compounds produced naturally by marine organisms. While some contaminants are well studied and regulated, many emerging pollutants remain poorly understood. Their sources, occurrence, environmental fate and potential impacts on marine ecosystems and human health are often insufficiently documented. These knowledge gaps make it difficult to assess risks, identify priority substances and establish appropriate regulatory measures.

My research aims to better understand these pollutants by combining environmental monitoring, advanced chemical analysis and lab experimentations. These approaches help identify contaminants, trace their sources and investigate how they behave and transform in aquatic environments. Understanding processes such as microbial degradation and photochemical transformation is essential to determine whether pollutants are effectively eliminated or converted into potentially harmful by-products. Climate change and changing environmental conditions may further influence their persistence, distribution and impacts.

Emerging pollutants are not necessarily all synthetic. Some are produced by biological processes and can also affect environmental quality and human health. Harmful marine microalgae, for example, can release volatile organic and sulfur compounds into water and air. Investigating these substances illustrates the importance of identifying and characterising pollutants that are not yet routinely monitored or fully understood.

The challenge is not only scientific but also regulatory. Without reliable data on the occurrence, fate and effects of these substances, it is difficult to define environmental quality standards, prioritise monitoring and implement effective policies. Research can help bridge this gap by providing the evidence needed to anticipate risks rather than respond only after environmental or health impacts become apparent.

By uncovering the sources, behaviour and potential effects of emerging marine pollutants, we can turn scientific uncertainty into actionable knowledge, support evidence-based regulation and contribute to the long-term protection of our seas and human health.

Maitena Salinas Beiztegi kazetariak hizlariarekin elkarrizketa izango du hitzaldia amaitutakoan | La periodista Maitena Salinas Beiztegi mantendrá un diálogo con la ponente una vez finalizada la conferencia.

Professeurs

Mathilde Monperrus

Investigadora en el Instituto de Ciencias Analíticas y Fisicoquímica para el Medio Ambiente y los Materiales (IPREM, CNRS – Universidad de Pau y Pays de l'Adour, Francia).

Mathilde Monperrus lleva 20 años investigando los contaminantes acuáticos en el Instituto IPREM. Con sede en Anglet, en el País Vasco francés, su equipo investiga los contaminantes emergentes —entre ellos, los contaminantes orgánicos e inorgánicos—, sus fuentes, su comportamiento en el medio ambiente, sus procesos de transformación y sus repercusiones en los ecosistemas y en la salud humana. Su investigación combina análisis químicos avanzados, espectrometría de masas y experimentos de laboratorio para detectar contaminantes e investigar su transformación y atenuación en los medios acuáticos. Además de su labor investigadora, es responsable de los programas de máster relacionados con el medio ambiente y la salud en la UPPA, entre ellos el Máster en Ciencias del Agua, y ejerce de coordinadora local del programa Erasmus Mundus ECT+ One Health.
